A-2703	SERVER-MAIL Phishing attempt possible download of malware	Medium	The user may have opened a malicious email and opened attachments or clicked links.	Escalated

Ticket comments
Alert A-2703 flagged a phishing email sent on July 20, 2022 at 9:30:14 AM to Inergy's HR inbox (hr@inergy.com, 176.157.125.93) that may have led to a malware download. The email posed as a job application but came from a suspicious address (76tguyhh6tgftrt7tg.su, 114.114.114.114), and the sender's name, "Def Communications," doesn't match the signature, "Clyde West." It also contains spelling and grammar errors, such as "Egnieer" and "Ingergy," and asks the recipient to open a password-protected attachment, a common way to get past email filters. The attachment, bfsvc.exe, is an executable, and its SHA256 hash (54e6ea47eb04634d3e87fd7787e2136ccfbcc80ade34f246a12cf93bab527f6b) was verified as malicious on VirusTotal, where 52 of 70 vendors flagged it as the Flagpro trojan. Because the attachment is confirmed malicious and the alert severity is Medium, I'm escalating this ticket to a level-two SOC analyst to find out whether the file was opened and to contain any infection.

Additional information

Known malicious file hash:
